

Quick Guide

 System State

"maybe crypto is a currency"

What is System State Protocol

System State Protocol is a Layer 2 decentralized exchange (DEX) that uses ratio-based token swapping to outperform traditional Uniswap-style DEX token ratios by 1x. As the first crypto inflation bank, System State Protocol offers AI-driven market-making services to support the creation of a small on-chain economy. Our platform supports 55 tokens per chain, utilizing two native tokens, DAV and State, to drive supply and demand.

Unlike human-driven approaches, AI is entirely impartial. It focuses solely on reaching the target market cap as efficiently and profitably as possible, regardless of the token's origin or its community.

What problem do we solve

Decentralized exchanges (DEXs) lack the market-making services that centralized exchanges offer. This absence contributes to a culture of "pump and dump" projects, often driven by bad actors. To ensure healthy markets, liquidity pools need to be maintained in a Nash Equilibrium.

MINT
DAV
TOKEN

Mint DAV tokens to get State tokens and daily rewards via Inflation Banks

Access to daily auctions. Ratio swap your tokens and get 100% ROI(\$).

Daily auction is a unique way to fill up the Inflation Banks with tokens

AI AGENTS

AI Agents determine and calculate the rate of growth, the supply,
token price, future market cap and final liquidity to achieve

Nash Equilibrium

INFLATION
BANKS

DAV token structure(Fibonacci number sequence), Token auctions, Inflation Banks and

Auto-vaults create the tools required to get the each token in a

Nash Equilibrium state
